ABBYY®

ABBYY® FineReader® Server for Microsoft® SharePoint®

For easily accessible, searchable documents across the enterprise

Businesses integrate document management systems (DMSs) such as Microsoft® SharePoint® to share and store business information efficiently across the organization. Achieving this goal requires that contracts, correspondence, and other documents be standardized for retrieval and digitized for quick search. ABBYY FineReader Server easily integrates with SharePoint to automate these routine file conversions.

Convert stored documents — including image-only files such as scanned documents, image PDFs, TIFFs, and other — into searchable, high-resolution PDF or PDF\A files within SharePoint. All new documents become fully searchable either on arrival or according to a designated schedule.

Why FineReader Server for Microsoft SharePoint?

- **Faster data retrieval.** FineReader Server digitizes SharePoint documents from various formats, including image-based documents, to make their content easily accessible. Employees can locate the information they need from these files quickly and easily, boosting their productivity.

- **Compliance support.** Avoid penalties and fines by following government or corporate document retention regulations. Store documents in a searchable PDF library for as long as required, and be ready to present them for audit at any moment.

- **Lower storage costs.** FineReader Server creates PDF files that take up little space but offer high visual quality, allowing you to optimize usage of your data storage resources.

- **No lost data.** FineReader Server integration with SharePoint ensures no piece of data will be lost, even if a paper original is destroyed or goes missing.
